## Appendix B

# Standard prelude

In this appendix we present some of the most commonly used definitions from the standard prelude. For expository purposes, a number of the definitions are presented in simplified form. The full version of the prelude is available from the Haskell home page, http://www.haskell.org.

#### B.1 Basic classes

```
Equality types:
```

Readable types:

class Read a where

read :: String -> a

```
Numeric types:
```

```
class Num a => Integral a where
   div, mod :: a -> a -> a
```

Fractional types:

#### B.2 Booleans

Type declaration:

Logical conjunction:

```
(&&) :: Bool -> Bool -> Bool
False && _ = False
True && b = b
```

Logical disjunction:

```
(||) :: Bool -> Bool -> Bool
False || b = b
True || _ = True
```

Logical negation:

```
not :: Bool -> Bool
not False = True
not True = False
```

Guard that always succeeds:

```
otherwise :: Bool
otherwise = True
```

#### **B.3** Characters

Type declaration:

The definitions below are provided in the library Data.Char, which can be loaded by including the following at the start of a script:

```
import Data.Char
```

Decide if a character is a lower-case letter:

```
isLower :: Char -> Bool
isLower c = c >= 'a' && c <= 'z'</pre>
```

Decide if a character is an upper-case letter:

```
isUpper :: Char -> Bool
isUpper c = c >= 'A' && c <= 'Z'</pre>
```

Decide if a character is alphabetic:

```
isAlpha :: Char -> Bool
isAlpha c = isLower c || isUpper c
```

Decide if a character is a digit:

```
isDigit :: Char -> Bool
isDigit c = c >= '0' && c <= '9'</pre>
```

Decide if a character is alpha-numeric:

```
isAlphaNum :: Char -> Bool
isAlphaNum c = isAlpha c || isDigit c
```

Decide if a character is spacing:

```
isSpace :: Char -> Bool
isSpace c = elem c " \t\n"
```

Convert a character to a Unicode number:

```
ord :: Char -> Int ord c = ...
```

Convert a Unicode number to a character:

```
chr :: Int \rightarrow Char chr n = ...
```

Convert a digit to an integer:

#### B.4 Strings

Type declaration:

```
type String = [Char]
```

#### B.5 Numbers

Type declarations:

Decide if an integer is even:

```
even :: Integral a \Rightarrow a \rightarrow Bool even n = n \mod 2 = 0
```

Decide if an integer is odd:

```
odd :: Integral a => a -> Bool
odd = not . even
```

Exponentiation:

```
(^) :: (Num a, Integral b) => a -> b -> a

_ ^ 0 = 1

x ^ n = x * (x ^ (n-1))
```

#### B.6 Tuples

Type declarations:

Select the first component of a pair:

Select the second component of a pair:

snd :: 
$$(a,b) \rightarrow b$$
  
snd  $(_,y) = y$ 

Convert a function on pairs to a curried function:

curry :: 
$$((a,b) \rightarrow c) \rightarrow (a \rightarrow b \rightarrow c)$$
  
curry f =  $x y \rightarrow f(x,y)$ 

Convert a curried function to a function on pairs:

uncurry :: 
$$(a \rightarrow b \rightarrow c) \rightarrow ((a,b) \rightarrow c)$$
  
uncurry  $f = (x,y) \rightarrow f x y$ 

#### B.7 Maybe

Type declaration:

#### B.8 Lists

Type declaration:

Select the first element of a non-empty list:

```
head :: [a] \rightarrow a
head (x:) = x
```

Select the last element of a non-empty list:

```
last :: [a] -> a
last [x] = x
last (_:xs) = last xs
```

Select the nth element of a non-empty list:

```
(!!) :: [a] -> Int -> a
(x:_) !! 0 = x
(_:xs) !! n = xs !! (n-1)
```

Select the first n elements of a list:

```
take :: Int -> [a] -> [a]
take 0 _ = []
take _ [] = []
take n (x:xs) = x : take (n-1) xs
```

Select all elements of a list that satisfy a predicate:

```
filter :: (a \rightarrow Bool) \rightarrow [a] \rightarrow [a]
filter p xs = [x \mid x \leftarrow xs, p x]
```

Select elements of a list while they satisfy a predicate:

Remove the first element from a non-empty list:

```
tail :: [a] -> [a] tail (_:xs) = xs
```

Remove the last element from a non-empty list:

```
init :: [a] -> [a]
init [_] = []
init (x:xs) = x : init xs
```

Remove the first n elements from a list:

```
drop :: Int -> [a] -> [a]
drop 0 xs = xs
drop _ [] = []
drop n (_:xs) = drop (n-1) xs
```

Remove elements from a list while they satisfy a predicate:

Split a list at the nth element:

```
splitAt :: Int -> [a] -> ([a],[a])
splitAt n xs = (take n xs, drop n xs)
```

Produce an infinite list of identical elements:

```
repeat :: a -> [a]
repeat x = xs where xs = x:xs
```

Produce a list with n identical elements:

```
replicate :: Int -> a -> [a]
replicate n = take n . repeat
```

Produce an infinite list by iterating a function over a value:

```
iterate :: (a \rightarrow a) \rightarrow a \rightarrow [a]
iterate f x = x : iterate f (f x)
```

Produce a list of pairs from a pair of lists:

Append two lists:

Reverse a list:

```
reverse :: [a] -> [a]
reverse = foldl (\xs x -> x:xs) []
```

Apply a function to all elements of a list:

map :: 
$$(a \rightarrow b) \rightarrow [a] \rightarrow [b]$$
  
map f xs = [f x | x <- xs]

#### **B.9** Functions

Type declaration:

data a 
$$\rightarrow$$
 b = ...

Identity function:

$$id :: a \rightarrow a$$
  
 $id = \x \rightarrow x$ 

Function composition:

(.) :: 
$$(b \rightarrow c) \rightarrow (a \rightarrow b) \rightarrow (a \rightarrow c)$$
  
f . g =  $\x \rightarrow f$  (g x)

Constant functions:

const :: 
$$a \rightarrow (b \rightarrow a)$$
  
const  $x = \setminus_{-} \rightarrow x$ 

Strict application:

$$(\$!)$$
 ::  $(a \rightarrow b) \rightarrow a \rightarrow b$   
f  $\$!$  x = ...

Flip the arguments of a curried function:

flip :: 
$$(a \rightarrow b \rightarrow c) \rightarrow (b \rightarrow a \rightarrow c)$$
  
flip f =  $y x \rightarrow f x y$ 

### B.10 Input/output

Type declaration:

```
data IO a = \dots
```

Read a character from the keyboard:

```
getChar :: IO Char
getChar = ...
```

Read a string from the keyboard:

Read a value from the keyboard:

Write a character to the screen:

```
putChar :: Char -> IO ()
putChar c = ...
```

Write a string to the screen:

Write a string to the screen and move to a new line:

Write a value to the screen:

```
print :: Show a => a -> IO ()
print = putStrLn . show
```

Display an error message and terminate the program:

```
error :: String -> a
error xs = ...
```

#### **B.11** Functors

Class declaration:

```
class Functor f where
  fmap :: (a -> b) -> f a -> f b
```

Maybe functor:

```
instance Functor Maybe where
  -- fmap :: (a -> b) -> Maybe a -> Maybe b
fmap g Nothing = Nothing
fmap g (Just x) = Just (g x)
```

List functor:

```
instance Functor [] where
      -- fmap :: (a -> b) -> [a] -> [b]
      fmap = map
IO functor:
   instance Functor IO where
      -- fmap :: (a \rightarrow b) \rightarrow I0 a \rightarrow I0 b
      fmap g mx = do \{x \leftarrow mx; return (g x)\}
Infix version of fmap:
   (<$>) :: Functor f => (a -> b) -> f a -> f b
   g < x = fmap g x
B.12
        Applicatives
Class declaration:
   class Functor f => Applicative f where
      pure :: a -> f a
      (<*>) :: f (a -> b) -> f a -> f b
Maybe applicative:
   instance Applicative Maybe where
      -- pure :: a -> Maybe a
      pure = Just
      -- (<*>) :: Maybe (a -> b) -> Maybe a -> Maybe b
      Nothing <*> _ = Nothing
      (Just g) <*> mx = fmap g mx
List applicative:
   instance Applicative [] where
      -- pure :: a -> [a]
      pure x = [x]
      -- (<*>) :: [a -> b] -> [a] -> [b]
      gs <*> xs = [g x | g <- gs, x <- xs]
IO applicative:
   instance Applicative IO where
     -- pure :: a -> IO a
     pure = return
     -- (<*>) :: IO (a -> b) -> IO a -> IO b
     mg \ll mx = do \{g \ll mg; x \ll mx; return (g x)\}
```

#### B.13 Monads

Class declaration:

```
class Applicative m => Monad m where
     return :: a -> m a
      (>>=) :: m a -> (a -> m b) -> m b
     return = pure
Maybe monad:
   instance Monad Maybe where
      -- (>>=) :: Maybe a -> (a -> Maybe b) -> Maybe b
     Nothing >>= _ = Nothing
      (Just x) >>= f = f x
List monad:
   instance Monad [] where
     -- (>>=) :: [a] -> (a -> [b]) -> [b]
     xs >>= f = [y | x <- xs, y <- f x]
IO monad:
   instance Monad IO where
     -- return :: a -> IO a
     return x = \dots
      -- (>>=) :: IO a -> (a -> IO b) -> IO b
     mx >>= f = ...
```

#### **B.14** Alternatives

The declarations below are provided in the library Control.Applicative, which can be loaded by include the following at the start of a script:

```
import Control.Applicative
```

Class declaration:

```
class Applicative f => Alternative f where
  empty :: f a
  (<|>) :: f a -> f a -> f a
  many :: f a -> f [a]
  some :: f a -> f [a]

many x = some x <|> pure []
  some x = pure (:) <*> x <*> many x
```

Maybe alternative:

```
instance Alternative Maybe where
    -- empty :: Maybe a
    empty = Nothing

-- (<|>) :: Maybe a -> Maybe a -> Maybe a
    Nothing <|> my = my
    (Just x) <|> _ = Just x

List alternative:

instance Alternative [] where
    -- empty :: [a]
    empty = []

-- (<|>) :: [a] -> [a] -> [a]
    (<|>) = (++)
```

#### B.15 MonadPlus

The declarations below are provided in the library Control.Monad, which can be loaded by include the following at the start of a script:

```
import Control.Monad
```

Class declaration:

```
class (Alternative m, Monad m) => MonadPlus m where
   mzero :: m a
   mplus :: m a -> m a -> m a

mzero = empty
   mplus = (<|>)
```

Maybe monadplus:

instance MonadPlus Maybe

List monadplus:

instance MonadPlus []

#### B.16 Monoids

Class declaration:

```
class Monoid a where
  mempty :: a
  mappend :: a -> a -> a
  mconcat :: [a] -> a
  mconcat = foldr mappend mempty
```

The definitions below are provided in a library file called Data. Monoid, which can be loaded by including the following declaration at the start of a script:

```
import Data.Monoid
Maybe monoid:
   instance Monoid a => Monoid (Maybe a) where
      -- mempty :: Maybe a
     mempty = Nothing
      -- mappend :: Maybe a -> Maybe a -> Maybe a
     Nothing 'mappend' my
                              = my
               'mappend' Nothing = mx
      Just x
               'mappend' Just y = Just (x 'mappend' y)
List monoid:
   instance Monoid [a] where
      -- mempty :: [a]
     mempty = []
      -- mappend :: [a] -> [a] -> [a]
     mappend = (++)
Numeric monoid for addition:
  newtype Sum a = Sum a
                   deriving (Eq, Ord, Show, Read)
  getSum :: Sum a -> a
  getSum (Sum x) = x
   instance Num a => Monoid (Sum a) where
      -- mempty :: Sum a
     mempty = Sum 0
      -- mappend :: Sum a -> Sum a -> Sum a
     Sum x 'mappend' Sum y = Sum (x+y)
```

Numeric monoid for multiplication:

```
newtype Product a = Product a
                       deriving (Eq, Ord, Show, Read)
   getProduct :: Product a -> a
   getProduct (Product x) = x
   instance Num a => Monoid (Product a) where
      -- mempty :: Product a
      mempty = Product 1
      -- mappend :: Product a -> Product a -> Product a
      Product x 'mappend' Product y = Product (x*y)
Boolean monoid for conjunction:
   newtype All = All Bool
                 deriving (Eq, Ord, Show, Read)
   getAll :: All -> Bool
   getAll (All b) = b
   instance Monoid All where
      -- mempty :: All
      mempty = All True
      -- mappend :: All -> All -> All
      All b 'mappend' All c = All (b && c)
Boolean monoid for disjunction:
   newtype Any = Any Bool
                 deriving (Eq, Ord, Show, Read)
   getAny :: Any -> Bool
   getAny (Any b) = b
   instance Monoid Any where
      -- mempty :: Any
      mempty = Any False
      -- mappend :: Any -> Any -> Any
      Any b 'mappend' Any c = Any (b | | c)
```

#### B.17 Foldables

Class declaration:

```
class Foldable t where
      foldMap :: Monoid b \Rightarrow (a \rightarrow b) \rightarrow t a \rightarrow b
             :: (a -> b -> b) -> b -> t a -> b
      foldr
             :: Monoid a => t a -> a
      fold
      foldl :: (a -> b -> a) -> a -> t b -> a
      foldr1 :: (a -> a -> a) -> t a -> a
      foldl1 :: (a \rightarrow a \rightarrow a) \rightarrow t a \rightarrow a
      toList :: t a -> [a]
              :: t a -> Bool
      null
      length :: t a -> Int
             :: Eq a => a -> t a -> Bool
      elem
      maximum :: Ord a => t a -> a
      minimum :: Ord a => t a -> a
           :: Num a => t a -> a
      product :: Num a => t a -> a
Default definitions:
      foldMap f = foldr (mappend . f) mempty
      foldr f v = foldr f v . toList
                = foldMap id
      fold
      foldl f v = foldl f v . toList
      foldr1 f = foldr1 f . toList
      foldl1 f = foldl1 f . toList
      toList
                = foldMap (\x -> [x])
               = null . toList
      null
      length = length . toList
      elem x = elem x . toList
      maximum = maximum . toList
      minimum = minimum . toList
                = sum . toList
      product
                = product . toList
List foldable:
   instance Foldable [] where
      -- foldMap :: Monoid b => (a -> b) -> [a] -> b
      foldMap f [] = mempty
      foldMap f (x:xs) = f x 'mappend' foldMap f xs
      -- foldr :: (a -> b -> b) -> b -> [a] -> b
      foldr _ v []
      foldr f v (x:xs) = f x (foldr f v xs)
```

```
-- fold :: Monoid a => [a] -> a
      fold = foldMap id
      -- foldl :: (a -> b -> a) -> a -> [b] -> a
      foldl _ v []
                       = v
      foldl f v (x:xs) = foldl f (f v x) xs
      -- foldr1 :: (a -> a -> a) -> [a] -> a
      foldr1 _ [x]
      foldr1 f (x:xs) = f x (foldr1 f xs)
      -- foldl1 :: (a -> a -> a) -> [a] -> a
      foldl1 f (x:xs) = foldl f x xs
      -- toList :: [a] -> [a]
      toList = id
      -- null :: [a] -> Bool
      null []
                = True
      null (:=) = False
      -- length :: [a] -> Int
      length = foldl (n - \rightarrow n+1) 0
      -- elem :: Eq a => a -> [a] -> Bool
      elem x xs = any (==x) xs
      -- maximum :: Ord a => [a] -> a
      maximum = foldl1 max
      -- minimum :: Ord a => [a] -> a
      minimum = foldl1 min
      -- sum :: Num a => [a] -> a
      sum = foldl (+) 0
      -- product :: Num a => [a] -> a
      product = foldl (*) 1
Decide if all logical values in a structure are True:
   and :: Foldable t => t Bool -> Bool
   and = getAll . foldMap All
Decide if any logical value in a structure is True:
   or :: Foldable t => t Bool -> Bool
   or = getAny . foldMap Any
```

Decide if all elements in a structure satisfy a predicate:

```
all :: Foldable t => (a \rightarrow Bool) \rightarrow t a \rightarrow Bool all p = getAll . foldMap (All . p)
```

Decide if any element of a structure satisfies a predicate:

```
any :: Foldable t => (a -> Bool) -> t a -> Bool any p = getAny . foldMap (Any . p)
```

Concatenate a structure whose elements are lists:

```
concat :: Foldable t => t [a] -> [a]
concat = fold
```

#### **B.18** Traversables

Class declaration:

```
class (Functor t, Foldable t) => Traversable t where
        traverse :: Applicative f \Rightarrow (a \rightarrow f b) \rightarrow t a \rightarrow f (t b)
        sequenceA :: Applicative f \Rightarrow t (f a) \rightarrow f (t a)
                    :: Monad m => (a -> m b) -> t a -> m (t b)
        sequence :: Monad m \Rightarrow t (m a) \rightarrow m (t a)
Default definitions:
        traverse g = sequenceA . fmap g
        sequenceA = traverse id
        mapM
                     = traverse
        sequence
                     = sequenceA
Maybe traversable:
   instance Traversable Maybe where
        -- traverse :: Applicative f =>
               (a \rightarrow f b) \rightarrow Maybe a \rightarrow f (Maybe b)
        traverse _ Nothing = pure Nothing
```

List traversable:

```
instance Traversable [] where
  -- traverse :: Applicative f => (a -> f b) -> [a] -> f [b]
  traverse g [] = pure []
  traverse g (x:xs) = pure (:) <*> g x <*> traverse g xs
```

traverse g (Just x) = pure Just <\*> g x
